

Fan-out - regex vs functional on sistema-sindico

Date: 2026-05-28 Models: 1 Tasks: 1 N values: 8 temperature: 0.7 use_cache: False

Engine: kernel.subagent_runtime.SubagentRuntime (PyPI simplicio-prompt 1.7.0). For each (model, task, N), N real parallel LLM calls through LaneWorkerPool; each output scored TWO ways: real PHPUnit (functional) and a regex pattern match (structural cheap proxy). The comparison shows where regex agrees with phpunit (cheap proxy works) and where regex inflates a pass that phpunit fails (regex is misleading).

Per (model, N) headline

Model	N	fn per-att	rx per-att	fn modal	rx modal	Cost
Qwen/Qwen2.5-Coder-3B-Instruct	8	100%	100%	1/1	1/1	\$0.0000

Per N (all models)

N	fn per-att	rx per-att	gap	fn modal	rx modal
8	100%	100%	+0	1/1	1/1

Regex vs phpunit gap per task

Task	fn	rx	gap (rx-fn)	verdict
password_strength	100%	100%	+0	regex agrees with phpunit

Interpretation

Functional (fn) = real phpunit exit code 0 on the FULL sindico suite including the per-case hidden test (or, for the bug-fix task, the existing PasswordPolicyTest). Regex (rx) = 'every structural pattern matched' on the generated file (per-task patterns in REGEX_CHECKS_BY_TASK). Where rx >> fn the regex metric inflates results -- code looks right but doesn't run; where they agree, regex is a usable cheap proxy.
